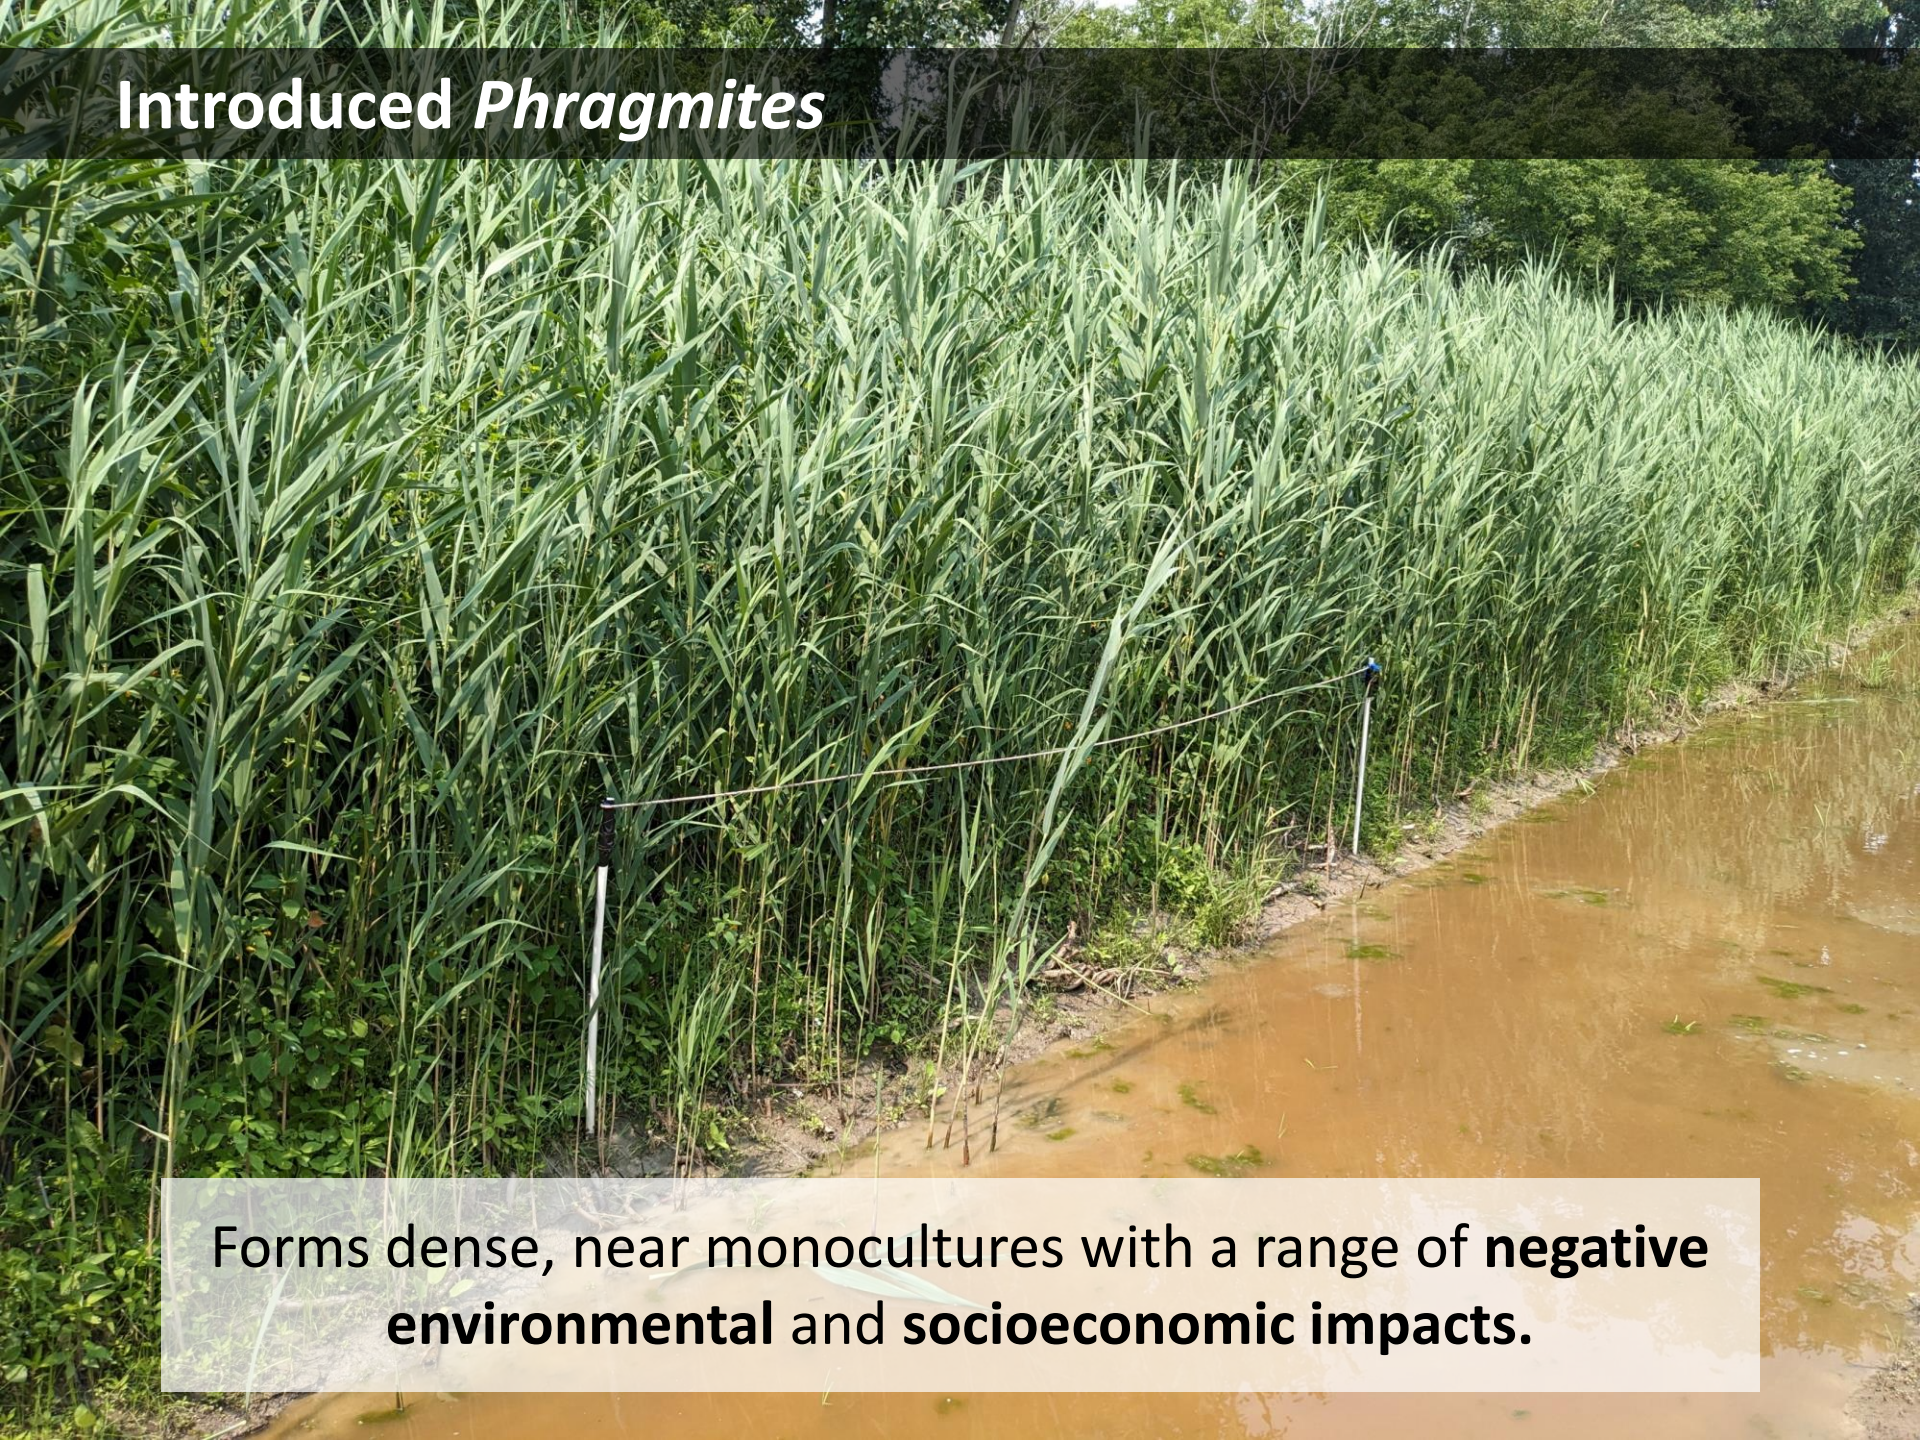
UNIVERSITY OF TORONTO

Agriculture and Agri-Food Canada

Introduced *Phragmites*

- **Introduced *Phragmites*** (*Phragmites australis australis*) named one of the worst weeds in North America (AAFC 2005).
- Tall **non-native, invasive grass** that spreads primarily through clonal belowground growth.
- Introduced to North America from Europe in the late 1800s.

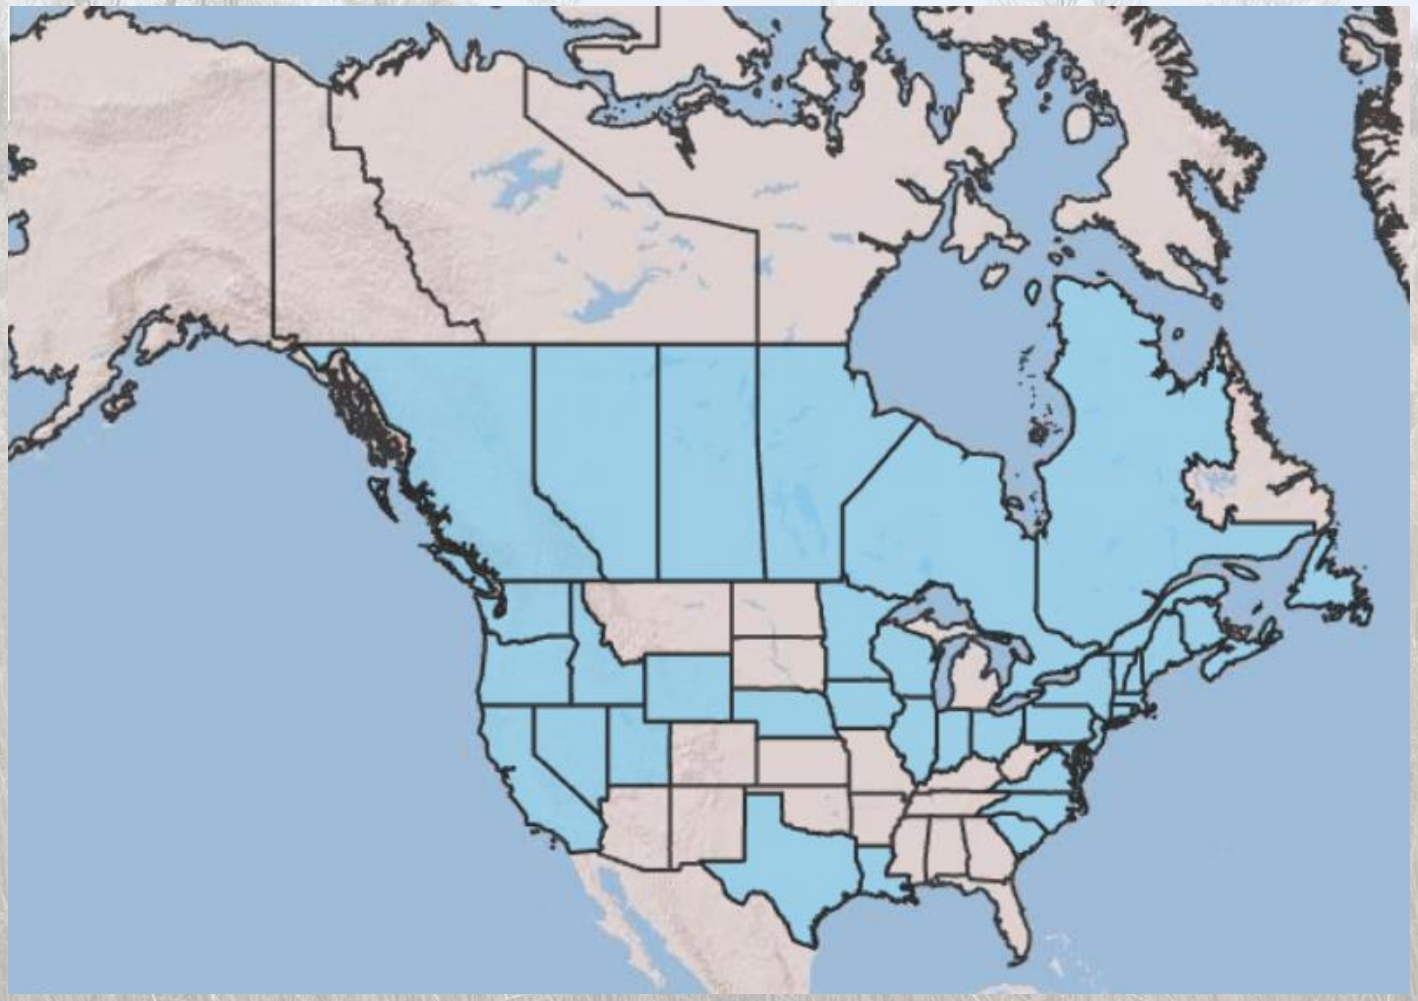
Introduced *Phragmites*



Forms dense, near monocultures with a range of **negative environmental** and **socioeconomic impacts.**

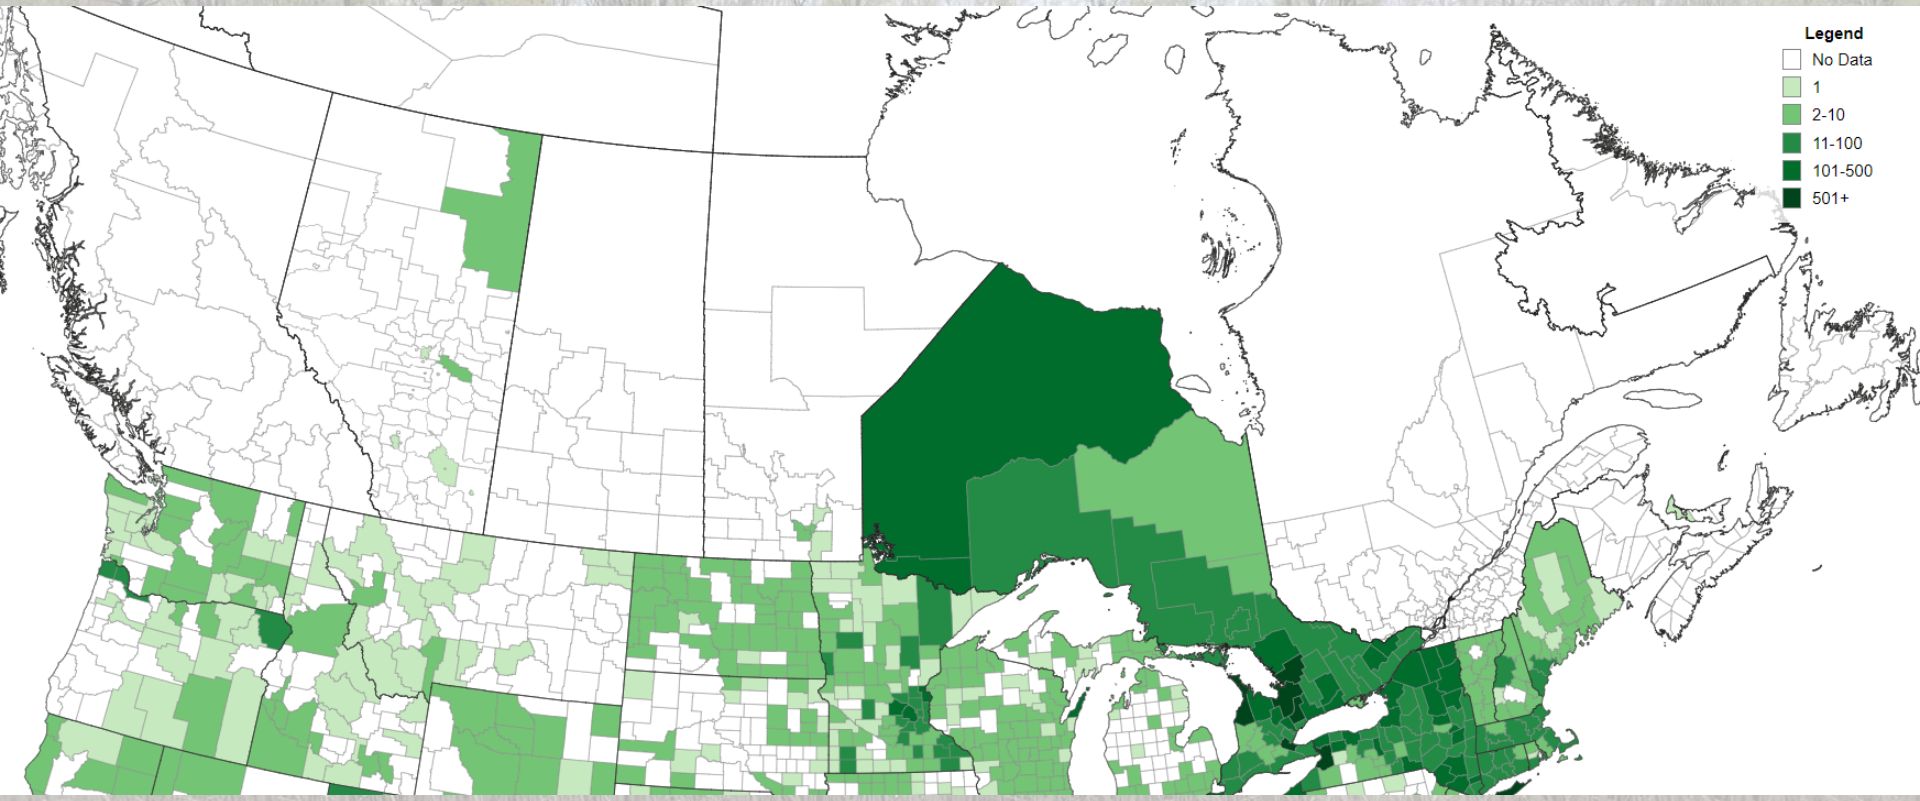
Introduced *Phragmites*

Common throughout Canada & US (USDA PLANTS database).



Introduced *Phragmites*

Different stage of invasion in AB vs. ON (EDDMapS).



Introduced *Phragmites*

- Two populations found near Brooks AB in 2016 and managed (alberta.ca).
- New populations documented around AB as of 2020.
- Likely gaps in reporting.
- Disturbance, spread, climate change → further invasion likely.

Introduced *Phragmites*

To effectively manage introduced *Phragmites*…

How can we reliably identify introduced Phragmites?

How do we practically manage a large-scale invasion?

How can we reliably identify introduced Phragmites?

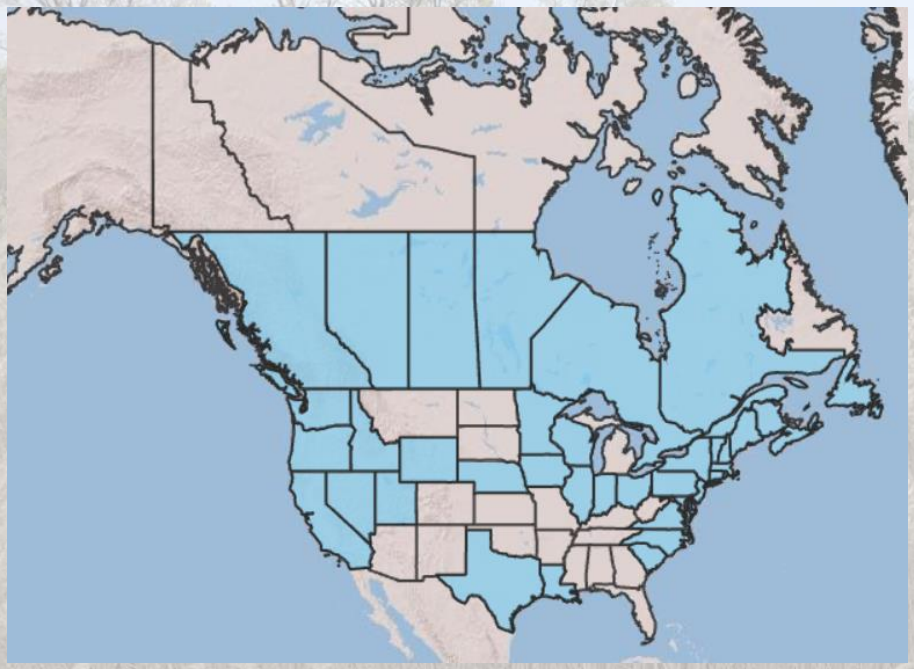
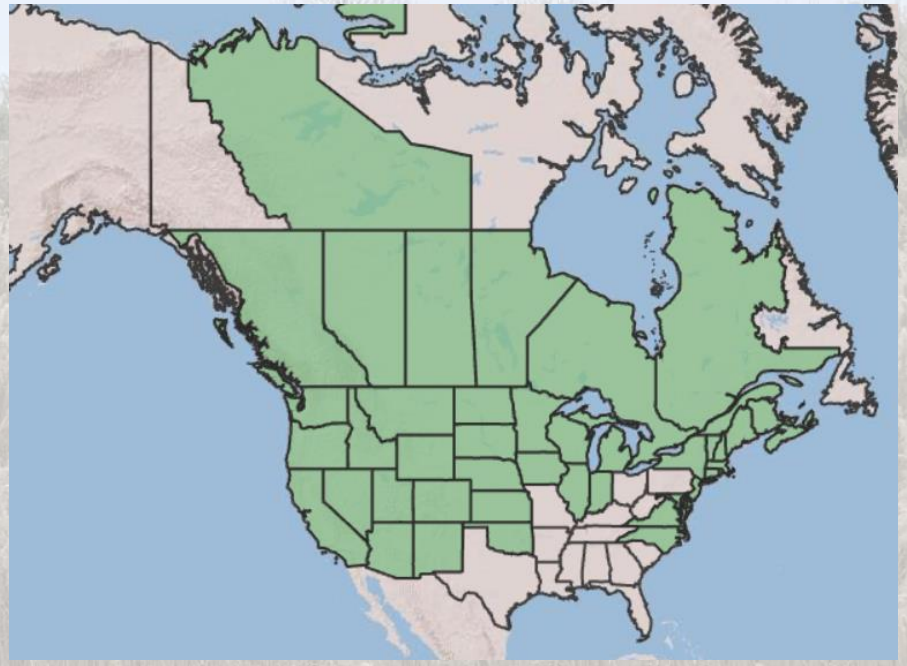
Morphological identification

Challenge: There are two main *Phragmites* lineages in Canada.



"Introduced *Phragmites*"
(*Phragmites australis australis*)

- "Canada's worst weed"
- Spreading.



"Native *Phragmites*"
(*Phragmites australis americanus*)

- Desirable native species.
- Rarer and disappearing.

Morphological identification

Despite guides, land managers are frequently worried about populations with "**atypical**" traits.

<u>Sources of confusion</u>

1. High concern about hybrids (very rare, not yet found in Canada).
2. High phenotypic plasticity.
3. Subjective traits.
4. "Common wisdom" and "rules of thumb".

Morphological identification

"Common wisdom" and "rules of thumb".

Native *Phragmites*

Introduced *Phragmites* always has large stems and leaves, high stem density, rough brown stems, and large panicles.

Morphological identification

E.g., moderate density patch with medium-sized, reddish-brown stems, and a mix of panicle sizes.

- **Genetic ID** is the most reliable option (including hybrid screening).
- Inaccessible to many land managers (e.g., lack of contacts, finances, collection knowledge).

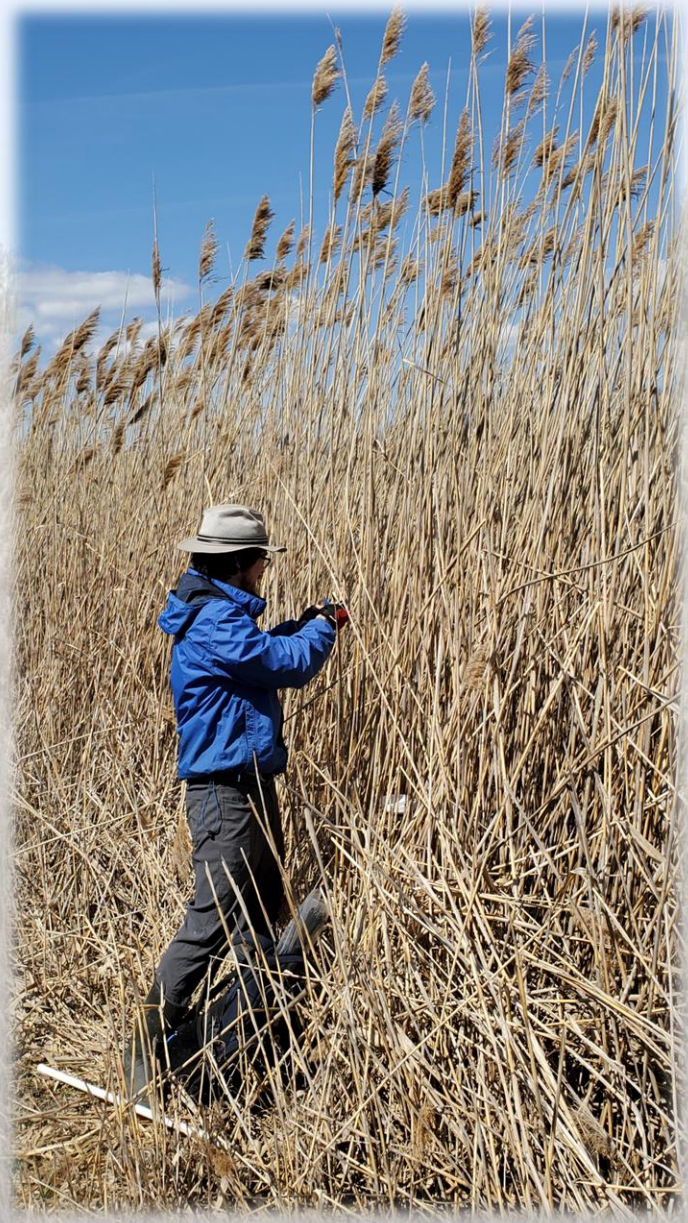
Morphological identification

Research objective:

To identify the best morphological traits to quickly and easily distinguish between introduced and native *Phragmites*.

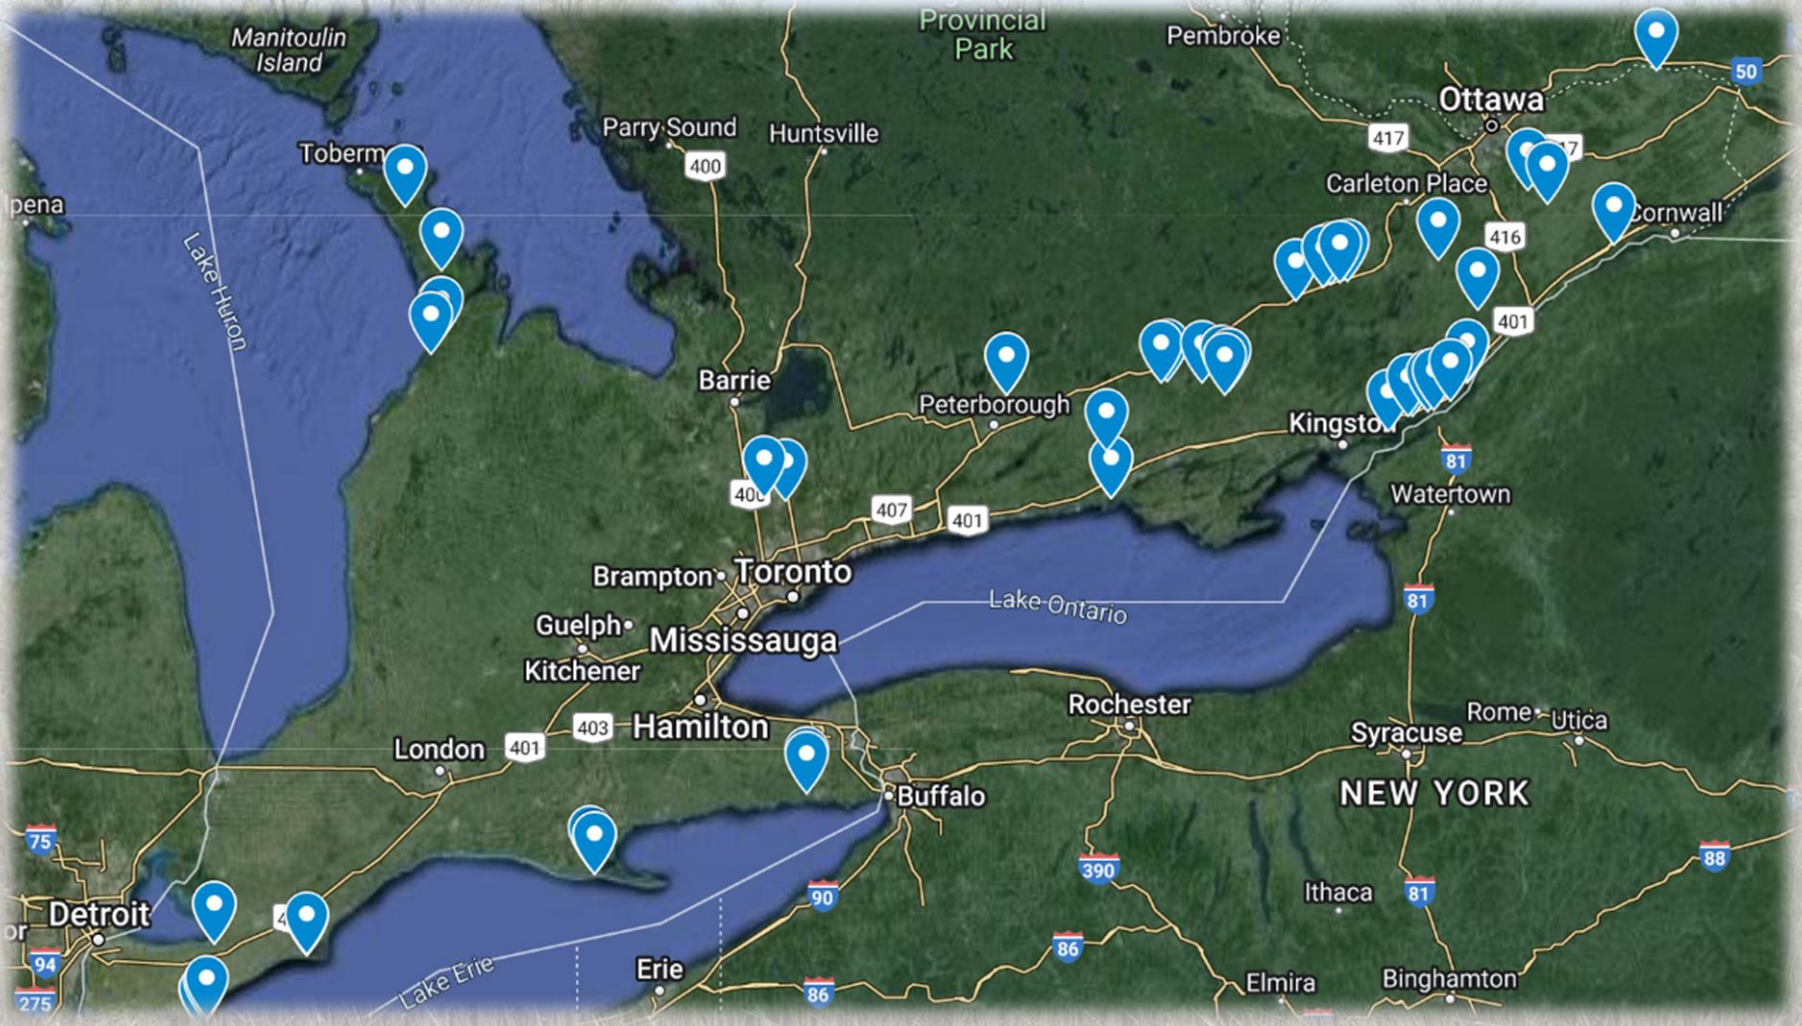
Management outcome:

Provide a free, easy-to-use *Phragmites* ID guide for land managers and researchers.



Morphological identification

Fall 2019: **Field surveys and collections** of 21 introduced and 27 native *Phragmites* populations in southern/eastern ON.



Morphological identification

Five subsamples per location: **field measurements** (e.g., stem density) + **stems** for lab + **dried leaf samples** for genetic ID (AAFC).

Measurement[a]	Description and reference(s)
1. Old stem density (m^{-2})	Density of old, standing, dead stems (m^{-2}) (Nichols 2020; Swearingen et al. 2022)
2. Living stem density (m^{-2})	Density of living, green stems (m^{-2}) (Nichols 2020; Swearingen et al. 2022)
3. Old stem leaf retention (%)	Percent (%) of internodes on a dead stem with leaf sheaths attached (Blossey 2003; Nichols 2020; Saltonstall et al. 2004; Swearingen et al. 2022)
4. Stem texture (1–4)	Categorical classification of the roughness of the second fully complete internode from the base of the stem (1 = very smooth; 2 = smooth with gentle ridges; 3 = lightly coarse/ridged; 4 = very coarse/ridged) (Allen et al. 2017; Blossey 2003; Nichols 2020; Saltonstall et al. 2004; Swearingen et al. 2022)
5. Stem spot fungus (%)	Percent (%) of five collected stems with any fungal spots on the internodes (Blossey 2003; Swearingen et al. 2022)
6. Stem color (1–4)	Categorical classification of the redness of the second fully complete internode from the base of the stem (1 = no redness; 2 = tinges of light redness; 3 = patches of darker red over <1/2 of internode; 4 = dark red over ≥1/2 of internode) (Allen et al. 2017; Blossey 2003; Catling and Mitrow 2011; Catling and Robichaud 2003; Catling et al. 2007; Nichols 2020; Swearingen et al. 2022)
7. Stem color hue	Hue (0–360 position on a color wheel) of the second fully complete internode from the base of the stem assessed by image analysis (see "Materials and Methods" for additional details)
8. Stem color saturation (%)	Saturation (% pigment intensity) of the second fully complete internode from the base of the stem assessed by image analysis (see "Materials and Methods" for additional details)
9. Stem color lightness (%)	Lightness (% whiteness of the color) of the second fully complete internode from the base of the stem assessed by image analysis (see "Materials and Methods" for additional details)
10. Stem height (m)	Height (m) from the base of the stem to the base of the inflorescence, measured using a meter stick (Nichols 2020)
11. Basal stem diameter (mm)	Diameter (mm) at the bottom of the stem, measured with calipers (Nichols 2020)
12. Mid-stem diameter (mm)	Diameter (mm) halfway up the stem, measured with calipers (Nichols 2020)
13. Top stem diameter (mm)	Diameter (mm) at the top of the stem at the base of the inflorescence, measured with calipers (Nichols 2020)
14. Inflorescence fullness (1–4)	Categorical classification of the fullness of the inflorescence, omitted if no inflorescence present (1 = small and spindly; 2 = small but filled out; 3 = large but sparse; 4 = bushy and full) (Nichols 2020; Swearingen et al. 2022)
15. Inflorescence height (cm)	Height (cm) from the base of the inflorescence to its highest point, measured using a meter stick (Allen et al. 2017; Nichols 2020)
16. Leaf length (cm)	Length (cm) of a leaf blade collected from the middle of the stem, measured from the center top of the ligule to the leaf tip (i.e., excluding the sheath), measured using a ruler (Allen et al. 2017)
17. Leaf width (cm)	Width (cm) of the same leaf measured for length at the widest point, measured using a ruler (Allen et al. 2017)
18. Ligule base height (mm)	Height (mm) of the dark tissue of the ligule, excluding the hairy fringe, measured with calipers under a microscope (Allen et al. 2017; Catling and Mitrow 2011; Catling et al. 2007; Nichols 2020)
19. Ligule full height (mm)	Height (mm) of the center of the ligule, including the dark tissue and hairy fringe, measured with calipers under a microscope (Catling et al. 2007; Saltonstall et al. 2004; Swearingen et al. 2022)
20. Lower glume length (mm)	Mean length of the lower glume (mm) from two random florets per sample, measured using calipers under a microscope (Allen et al. 2017; Catling and Mitrow 2011; Catling and Robichaud 2003; Catling et al. 2007; Nichols 2020; Saltonstall et al. 2004; Swearingen et al. 2022)
21. Upper glume length (mm)	Mean length of the upper glume (mm) from two random florets per sample, measured using calipers under a microscope (Allen et al. 2017; Nichols 2020; Saltonstall et al. 2004; Swearingen et al. 2022)
22. Lemma length (mm)	Mean length of the lemma (mm) from two random florets per sample, measured using a scale bar under a microscope (Allen et al. 2017; Nichols 2020; Saltonstall et al. 2004)

Measurement[a]	Description and reference(s)
1. Old stem density (m^{-2})	Density of old, standing, dead stems (m^{-2}) (Nichols 2020; Swearingen et al. 2022)
2. Living stem density (m^{-2})	Density of living, green stems (m^{-2}) (Nichols 2020; Swearingen et al. 2022)

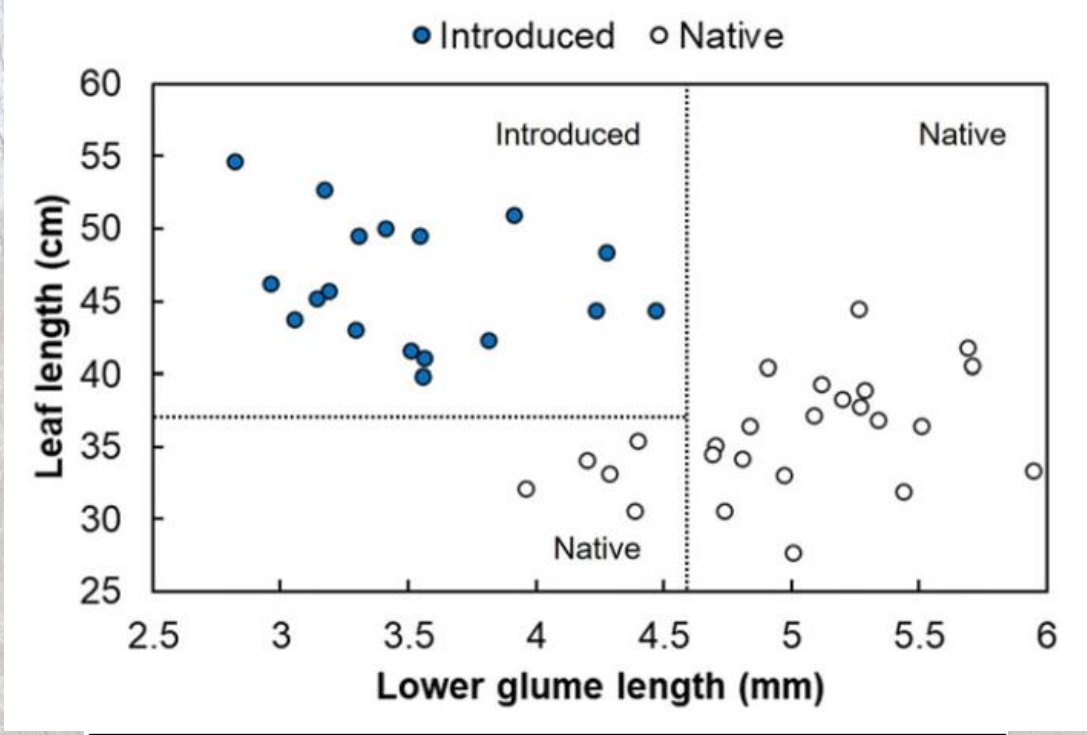
Living stem density (m^{-2})	$F(1, 44) = 3.2$, P = 0.083	0.04	91	65 ± 28 (24–129)	52 ± 23 (4–101)

Also, **stem spot fungus** ONLY occurs on native
(i.e., absence is uninformative, presence is diagnostic).

Morphological identification



1A. Lower glume length > 4.6 mm: native *Phragmites australis* ssp. *americanus*
1B. Lower glume length < 4.6 mm:
2A. Leaf length > 37 cm: introduced *Phragmites australis* ssp. *australis*
2B. Leaf length < 37 cm: native *Phragmites australis* ssp. *americanus*

Finally, a simple binomial key of **lower glume length** and **leaf length** also provides separation.

Morphological identification

Native vs. introduced *Phragmites* ID checklist (Adapted from McTavish MJ, Smith T, Mechanda S, Smith SM, Bourchier RS. 2023. Morphological traits for rapid and simple separation of native and introduced *Phragmites australis*. *Invasive Plant Science and Management*)

Use this checklist to help identify unknown populations of *Phragmites* as native (*Phragmites australis americanus*) or introduced (*Phragmites australis australis*). For each trait, follow "How to measure" and check the corresponding box. If all check boxes match either native or introduced *Phragmites*, the sample can be identified with high confidence. If there is incomplete consensus, identification should be considered inconclusive and followed by genetic testing where possible. For best results: (a) measure as many traits as possible; (b) test multiple stems per patch; and (c) collect measurements in late summer or fall when the differences are most pronounced. Contact: michael.mctavish@alum.utoronto.ca.

Trait	Stem spot fungus	Stem colour	Leaf retention	Ligule base height	Lower glume length + leaf length
How to measure	Check living stems for dark round fungal spots (arrow A).	Check the base of the stem for dark red colouration.	Inspect greying dead stems (i.e., not living stems) to determine how much is still covered by attached leaf sheaths (arrow C). When leaf sheaths have fallen off, the stem below will be bare (arrow D).	Remove a leaf from the middle of the plant. Use calipers or a ruler to measure the height of the dark membranous band where the leaf meets the stem (i.e., the ligule), excluding any light-coloured, hairy fringe at the top of the band (arrow E).	Press a floret under glass and measure lower glume length (arrow F) using calipers or a ruler under a microscope. Find a leaf near the middle of the stem. Measure its length from ligule to tip (arrow G) using a ruler.
Introduced *Phragmites australis*	Stems without round fungal spots (arrow A) or dark red may be either introduced or native *P. australis*. Dark smudges (arrow B) are not diagnostic. 		☐ > 50% attached (stem mostly covered) 	☐ ≤ 0.15 mm 	☐ Lower glume < 4.6 mm and leaf length > 37 cm 
Native *Phragmites australis*	 ☐ Round spots present	 ☐ Dark red, up to 100% coverage	 ☐ < 30% attached (stem mostly bare)	 ☐ > 0.35 mm	 ☐ Lower glume > 4.6 mm, OR lower glume < 4.6 mm and leaf length < 37 cm

Introduced *Phragmites australis*	Stems without round fungal spots (arrow A) or dark red may be either introduced or native *P. australis*. Dark smudges (arrow B) are not diagnostic. 		☐ > 50% attached (stem mostly covered) 	☐ ≤ 0.15 mm 	☐ Lower glume < 4.6 mm and leaf length > 37 cm 
Native *Phragmites australis*	 ☐ Round spots present	 ☐ Dark red, up to 100% coverage	 ☐ < 30% attached (stem mostly bare)	 ☐ > 0.35 mm	 ☐ Lower glume > 4.6 mm, OR lower glume < 4.6 mm and leaf length < 37 cm

How to use:

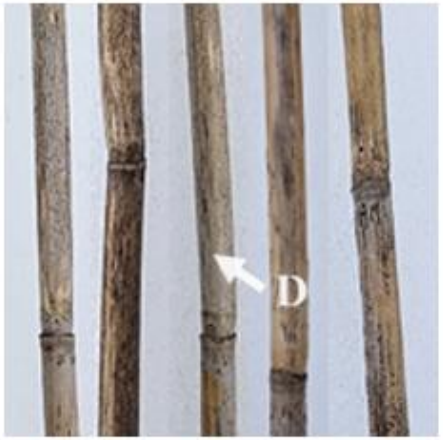
1. Read "How to measure".
2. Measure stem.
3. Check corresponding box (native or introduced).
4. Check for agreement across as many traits as possible.

Morphological identification

Introduced *Phragmites*:

Native *Phragmites*:

☐ > 50% attached
(stem mostly covered)



☐ < 30% attached
(stem mostly bare)

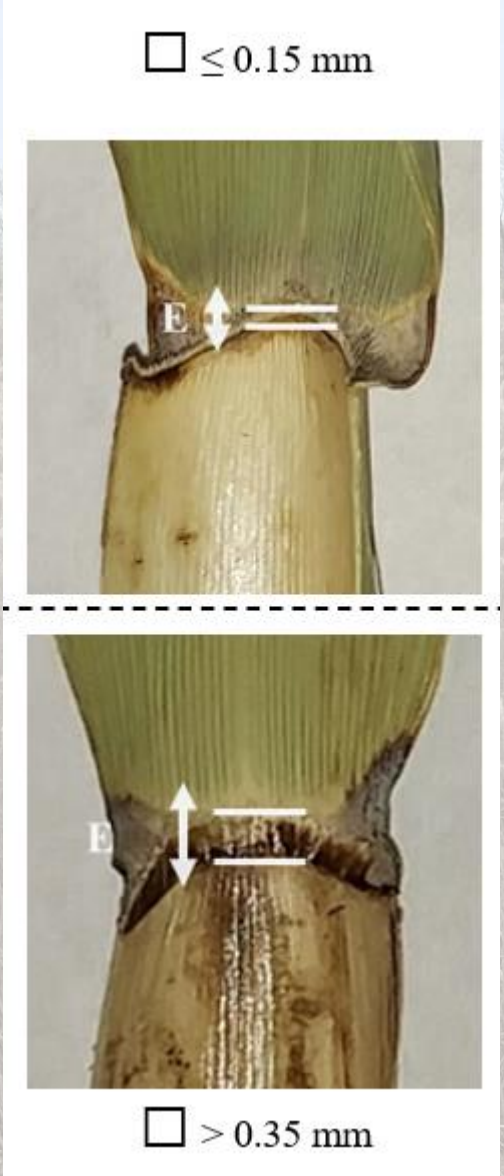
Leaf retention

Inspect greying dead stems (i.e., not living stems) to determine how much is still covered by attached leaf sheaths (arrow C). When leaf sheaths have fallen off, the stem below will be bare (arrow D).

Morphological identification

Introduced *Phragmites*:

Native *Phragmites*:



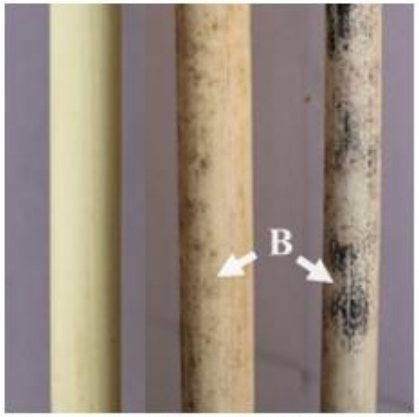
Ligule base height

Remove a leaf from the middle of the plant. Use calipers or a ruler to measure the height of the dark membranous band where the leaf meets the stem (i.e., the ligule), excluding any light-coloured, hairy fringe at the top of the band (arrow E).

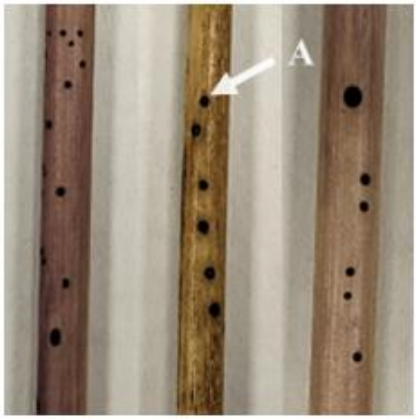
Morphological identification

Introduced *Phragmites*:

Stems without round fungal spots (arrow A) or dark red may be either introduced or native *P. australis*. Dark smudges (arrow B) are not diagnostic.



Native *Phragmites*:



☐ Round spots present

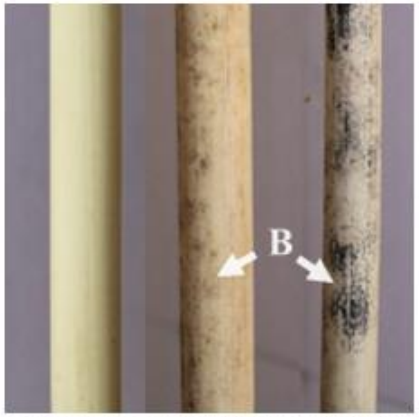
Stem spot fungus

Check living stems for dark round fungal spots (arrow A).

Morphological identification

Introduced *Phragmites*:

Stems <u>without</u> round fungal spots (arrow A) or dark red may be either introduced or native *P. australis*. Dark smudges (arrow B) are not diagnostic.



Native *Phragmites*:

☐ Dark red, up to 100% coverage

Stem colour

Check the base of the stem for dark red colouration.

Morphological identification

Introduced *Phragmites*:

☐ Lower glume < 4.6 mm and leaf length > 37 cm

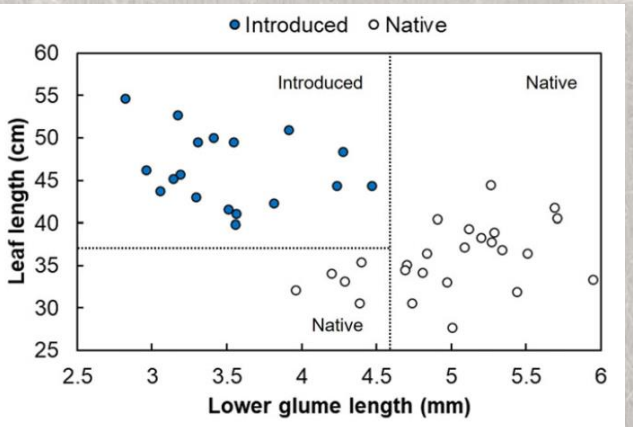
☐ Lower glume > 4.6 mm, OR lower glume < 4.6 mm and leaf length < 37 cm

Native *Phragmites*:

Lower glume length + leaf length

Press a floret under glass and measure lower glume length (arrow F) using calipers or a ruler under a microscope.

Find a leaf near the middle of the stem. Measure its length from ligule to tip (arrow G) using a ruler.



Morphological identification

ID key considerations:

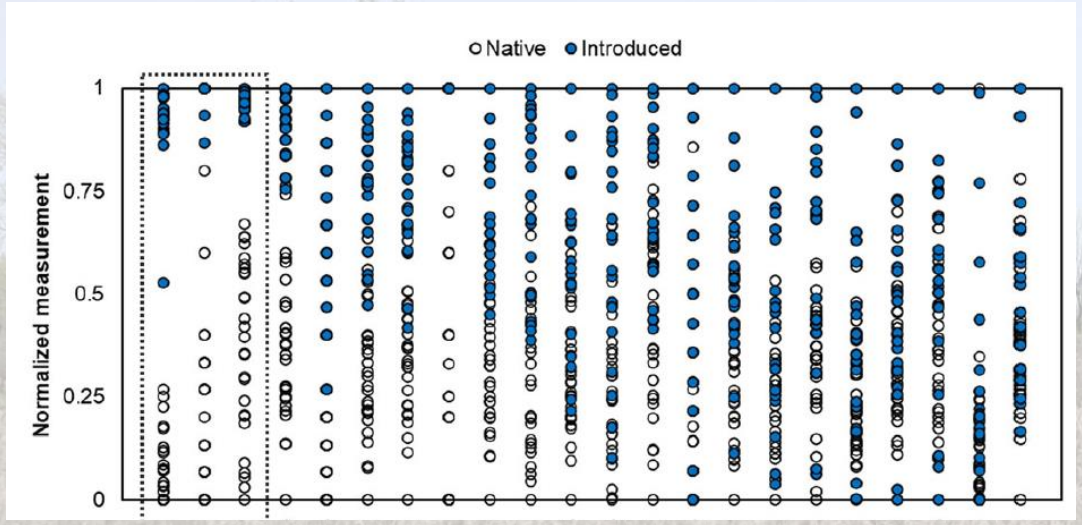
1. Differences most evident in late summer/fall (leaf sheath retention is year-round).

2. Measure as many stems as possible.

3. Lack of consensus → genetic testing.

4. Data based on 48 populations from Great Lakes region (likely still informative but may need local adjustments).

Morphological identification



Native vs. introduced *Phragmites* ID checklist (Adapted from McTavish MJ, Smith T, Mechanda S, Smith SM, Bourchier RS. 2023. Morphological traits for rapid and simple separation of native and introduced *Phragmites australis*. *Invasive Plant Science and Management*)

Use this checklist to help identify unknown populations of *Phragmites* as native (*Phragmites australis americanus*) or introduced (*Phragmites australis australis*). For each trait, follow "How to measure" and check the corresponding box. If all check boxes match either native or introduced *Phragmites*, the sample can be identified with high confidence. If there is incomplete consensus, identification should be considered inconclusive and followed by genetic testing where possible. For best results: (a) measure as many traits as possible; (b) test multiple stems per patch; and (c) collect measurements in late summer or fall when the differences are most pronounced. Contact: michael.mctavish@alum.utoronto.ca.

Trait	Stem spot fungus	Stem colour	Leaf retention	Ligule base height	Lower glume length + leaf length
How to measure	Check living stems for dark round fungal spots (arrow A).	Check the base of the stem for dark red colouration.	Inspect greying dead stems (i.e., not living stems) to determine how much is still covered by attached leaf sheaths (arrow C). When leaf sheaths have fallen off, the stem below will be bare (arrow D).	Remove a leaf from the middle of the plant. Use calipers or a ruler to measure the height of the dark membranous band where the leaf meets the stem (i.e., the ligule), excluding any light-coloured, hairy fringe at the top of the band (arrow E).	Press a floret under glass and measure lower glume length (arrow F) using calipers or a ruler under a microscope. Find a leaf near the middle of the stem. Measure its length from ligule to tip (arrow G) using a ruler.
Introduced *Phragmites australis*	Stems without round fungal spots (arrow A) or dark red may be either introduced or native *P. australis*. Dark smudges (arrow B) are not diagnostic. 		☐ > 50% attached (stem mostly covered) 	☐ ≤ 0.15 mm 	☐ Lower glume < 4.6 mm and leaf length > 37 cm 
Native *Phragmites australis*	 ☐ Round spots present	 ☐ Dark red, up to 100% coverage	 ☐ < 30% attached (stem mostly bare)	 ☐ > 0.35 mm	 ☐ Lower glume > 4.6 mm, OR lower glume < 4.6 mm and leaf length < 37 cm

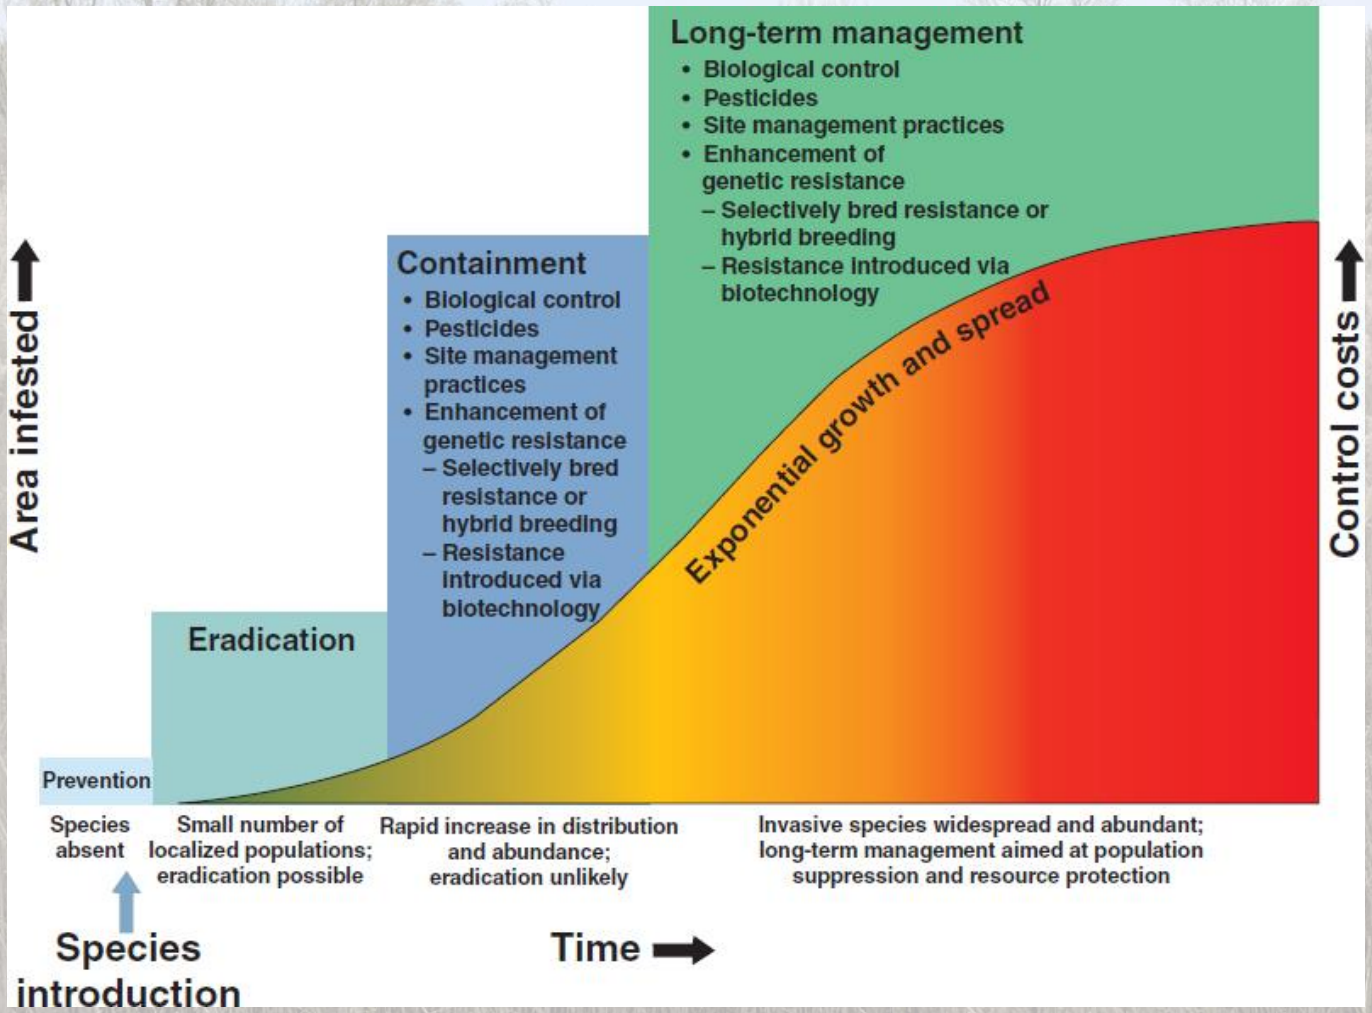
General conclusions

- Native and introduced have a lot of variation and overlap.
- "Atypical" intermediate traits → very common and normal!
- "Common wisdom" and "rules of thumb" may be misleading → diagnostic traits.

How do we practically manage a large-scale invasion?

Biological control of introduced *Phragmites*

Large-scale invasions quickly outpace practical and financial realities of eradication or containment.



Biological control of introduced *Phragmites*

Biological control provides “another tool in the toolbox” to manage the long-term, large-scale invasion of *Phragmites*.

Biological control of introduced *Phragmites*

Biological control or **"biocontrol"** uses living organisms to **gradually suppress** a pest at **large-scale** over the **long-term**.

<u>Why use biocontrol</u>?

1. Re-establish ecological balance.
2. Safe with low off-target environmental impact.
3. Cost-effective, large-scale, and long-term.

Biological control of introduced *Phragmites*

Biocontrol agents are two European moths with stem-boring larvae:

Archanara neurica

Lenisa geminipuncta

Larvae mine
3-4 stems

Kills young stems

Stem wilt

Borehole

Stunts older stems

Stem wilt

Borehole

Biological control of introduced *Phragmites*

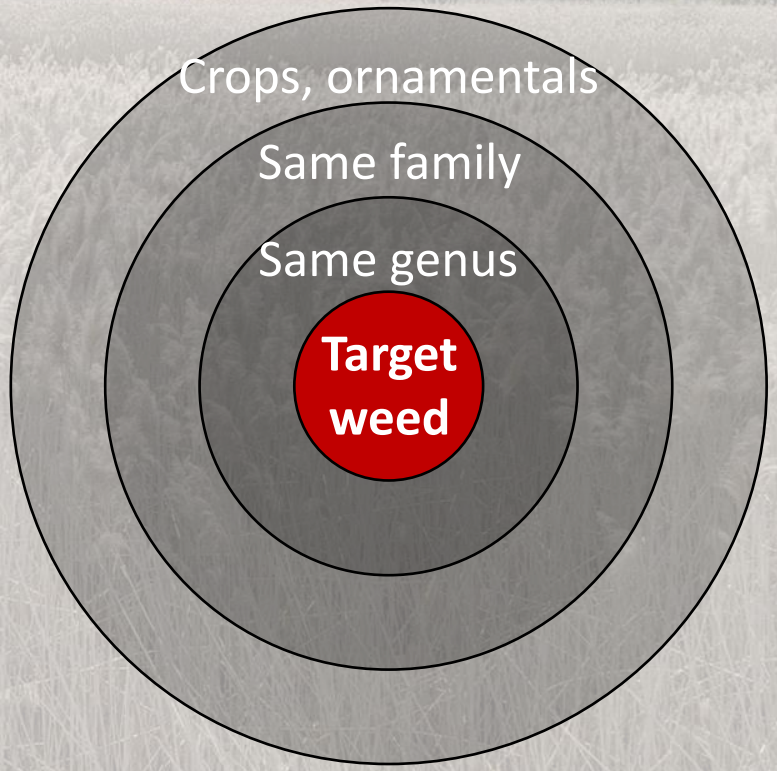
Larvae reduce *Phragmites* **stem density**, **stem height**, and **panicle formation** → less competitive → increased biodiversity & function.

Biological control of introduced *Phragmites*

1998-2019

Phase 1: Agent identification & permitting

- International team (Canada, US, Switzerland).
- Identify agents and extensive host range testing.
- Canadian release permit approved by CFIA in 2019.

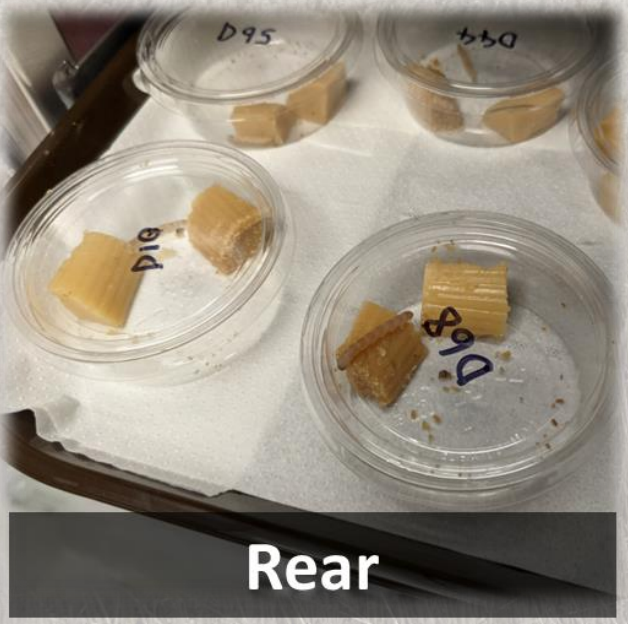


Biological control of introduced *Phragmites*

1998-2019 | **2019-2023**

Phase 2: Developing operational protocols

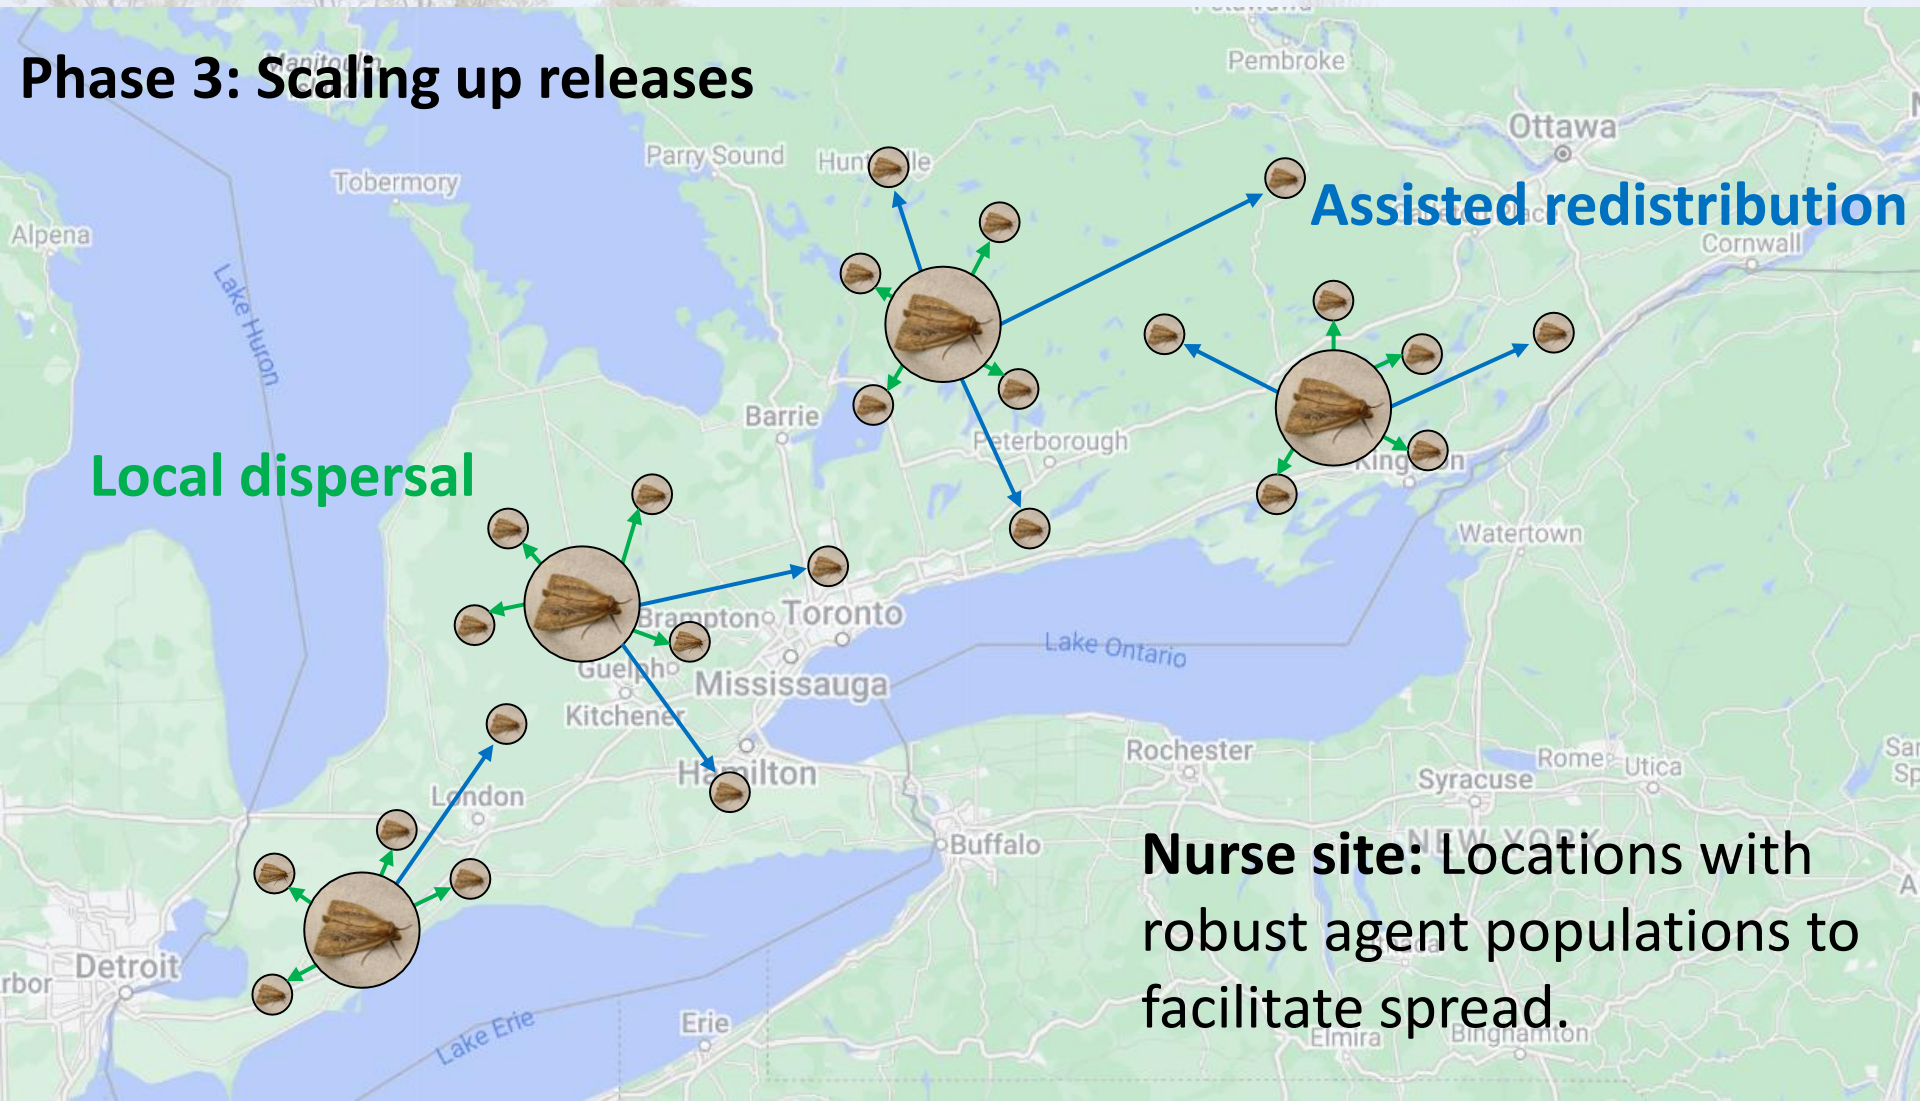
- First Canadian releases (Ontario).



Biological control of introduced *Phragmites*

1998-2019 | 2019-2023 | 2023+

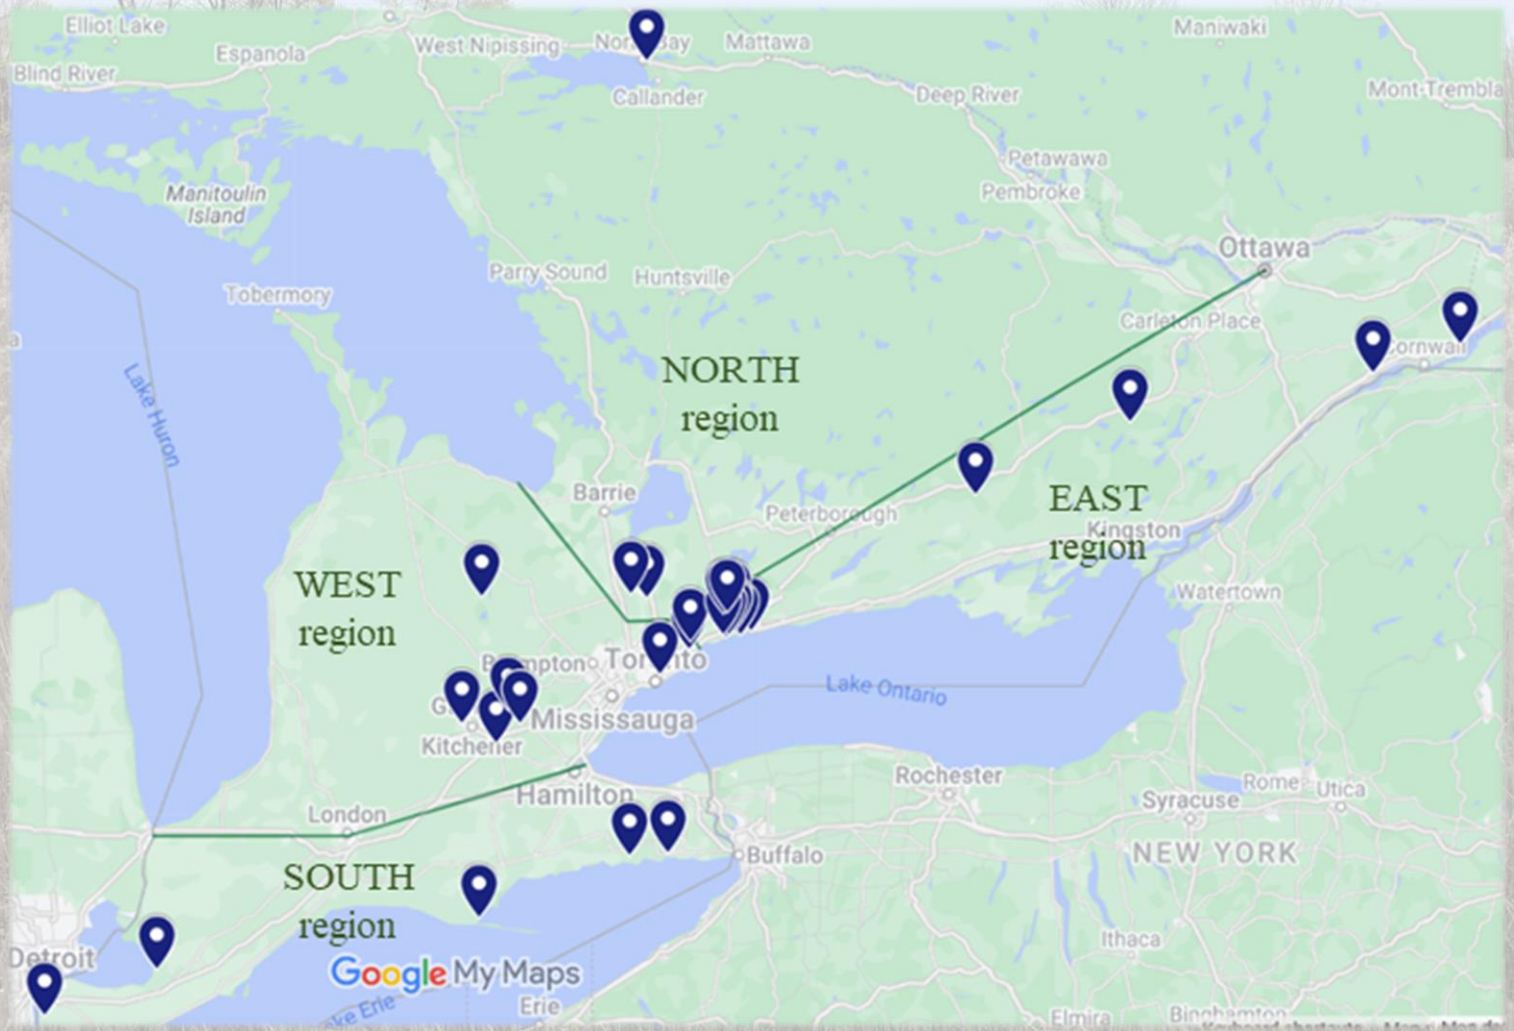
Phase 3: Scaling up releases



Nurse site: Locations with robust agent populations to facilitate spread.

Biological control of introduced *Phragmites*

From 2019 to 2023, we have released ~**21,000 insects** across **30 sites** in Ontario.



Growing **long-term annual dataset** tracking feeding damage (damaged stems per m^2).

Site	Year 1 [release point]	Year 2 [patch level]	Year 3 [patch level]
P01: Davern	N/A	0.0 ± 0.0 (n = 14)	0.0 ± 0.0 (n = 14)
P02: Aurora	12.3 ± 16.0 (n = 11)	2.0 ± 2.4 (n = 38)	3.4 ± 2.0 (n = 39)
P03: Wainfleet	N/A	0.1 ± 0.2 (n = 18)	0.1 ± 0.2 (n = 18)
P04: Sinclair Campbell	18.5 ± 16.8 (n = 14)	5.2 ± 4.5 (n = 20)	4.7 ± 3.5 (n = 16)

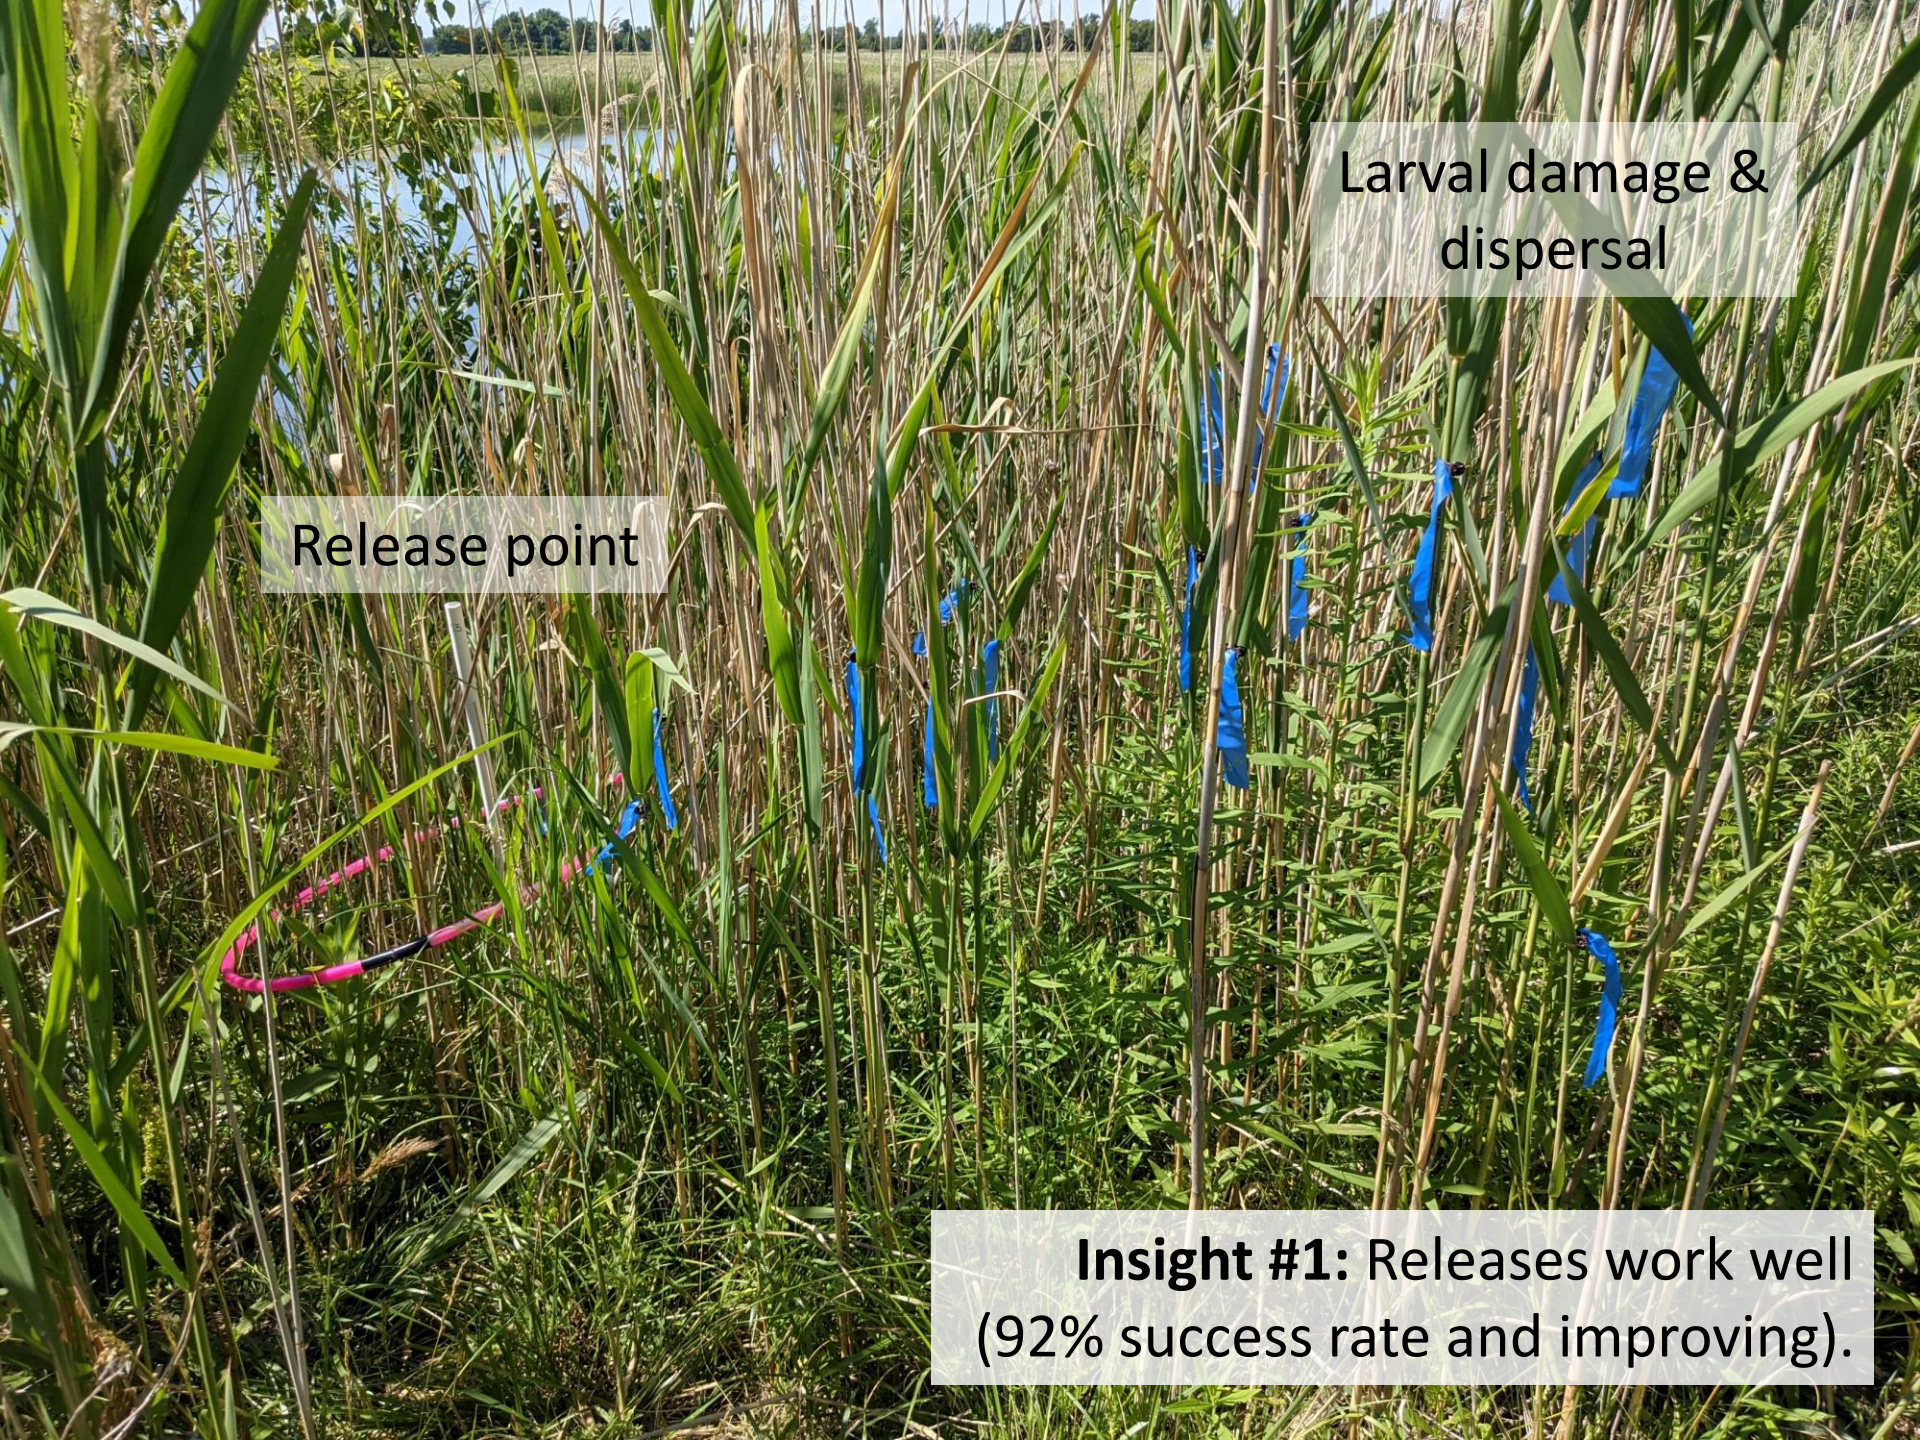
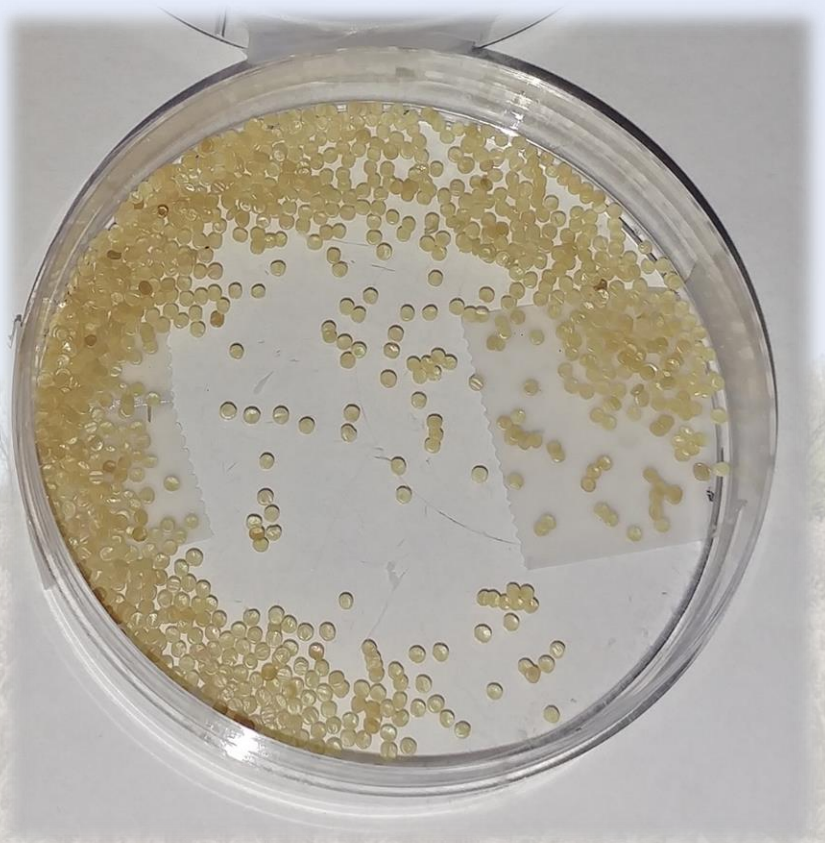
P12: rare	12.9 ± 14.2 (n = 11)	1.8 ± 2.6 (n = 55)	-
P06: Koffler	28.1 ± 12.4 (n = 9)	-	-
P13: Dunnville	0.2 ± 0.2 (n = 6)	-	-
P14: Cranberry	11.0 ± 10.3 (n = 30)	-	-
P15: Mac Coutts	13.4 ± 8.2 (n = 9)	-	-
P16: Collavino	33.5 ± 20.3 (n = 18)	-	-
P17: Cooper	25.4 ± 13.1 (n = 9)	-	-
P18: Whitby	9.0 ± 8.0 (n = 3)	-	-
P19: Brickworks	15.6 ± 10.3 (n = 6)	-	-
P20: St. Lukes	26.1 ± 12.6 (n = 12)	-	-
P21: Brimblecombe	15.1 ± 12.9 (n = 6)	-	-
P22: North Bay	6.0 ± 10.4 (n = 3)	-	-
P23: Garrard	6.0 (n = 1)	-	-
P24: Nichol	6.0 (n = 1)	-	-
P25: Victoria	(Site destroyed)	-	-
P26: Gordon	9.0 (n = 1)	-	-
P27: Lakeridge	0.0 (n = 1)	-	-
P28: Cochrane	3.0 (n = 1)	-	-
P29: Brooklin	0.0 (n = 1)	-	-
P30: Donkey	1.5 ± 2.1 (n = 2)	-	-



Larval damage & dispersal
Release point
Insight #1: Releases work well (92% success rate and improving).

Insight #2: Annual damage persists post-release (indicating agent reproduction, overwintering, and local dispersal).



Insight #3: Eggs can be practically harvested from release sites by cutting stems (e.g., 3rd year nurse site: 116 stems → 367 eggs).

Biological control of introduced *Phragmites*

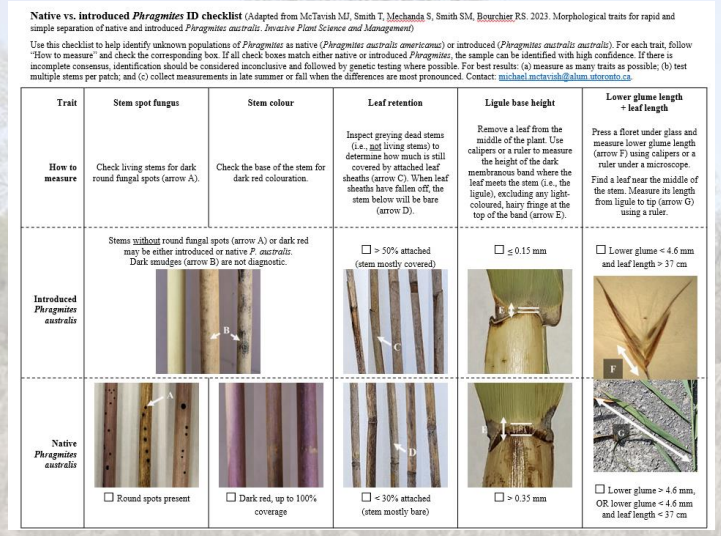
- Core protocols developed and initial releases **highly encouraging.**
- Focus on **scaling up** nurse sites and **integrating** with existing province-wide management plans (ON).
- Nurse sites on-track to begin producing additional eggs for **wider redistribution** (e.g., inter-provincial) to priority sites by spring 2025.

Summary

Summary

- **Introduced *Phragmites*** is a highly competitive invasive weed; widespread in ON, may become more common in AB.
- **Diagnostic traits** are essential to reliably and practically distinguish the weed from native *Phragmites*.
- **Biological control** is growing as a “new tool in the toolbox” to help manage introduced *Phragmites*.

Summary



Native vs. introduced *Phragmites* ID checklist (Adapted from McTavish MJ, Smith T, Mechanda S, Smith SM, Bourchier RS. 2023. Morphological traits for rapid and simple separation of native and introduced *Phragmites australis*. *Invasive Plant Science and Management*)

Use this checklist to help identify unknown populations of *Phragmites* as native (*Phragmites australis americanus*) or introduced (*Phragmites australis australis*). For each trait, follow "How to measure" and check the corresponding box. If all check boxes match either native or introduced *Phragmites*, the sample can be identified with high confidence. If there is incomplete consensus, identification should be considered inconclusive and followed by genetic testing where possible. For best results: (a) measure as many traits as possible; (b) test multiple stems per patch; and (c) collect measurements in late summer or fall when the differences are most pronounced. Trait	Stem spot fungus	Stem colour	Leaf retention	Ligule base height	Lower glume length + leaf length
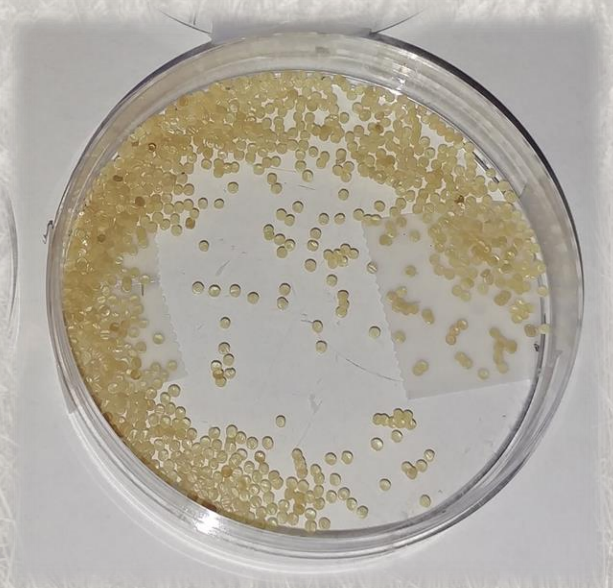
How to measure	Check living stems for dark round fungal spots (arrow A).	Check the base of the stem for dark red colouration.	Inspect greying dead stems (i.e., not living stems) to determine how much is still covered by attached leaf sheaths (arrow C). When leaf sheaths have fallen off, the stem below will be bare (arrow D).	Remove a leaf from the middle of the plant. Use calipers or a ruler to measure the height of the dark membranous band where the leaf meets the stem (i.e., the ligule), excluding any light-coloured, hairy fringe at the top of the band (arrow E).	Press a floret under glass and measure lower glume length (arrow F) using calipers or a ruler under a microscope. Find a leaf near the middle of the stem. Measure its length from ligule to tip (arrow G) using a ruler.
Introduced *Phragmites australis*	Stems without round fungal spots (arrow A) or dark red may be either introduced or native *P. australis*. Dark smudges (arrow B) are not diagnostic.		☐ > 50% attached (stem mostly covered)	☐ ≤ 0.15 mm	☐ Lower glume < 4.6 mm and leaf length > 37 cm
Native *Phragmites australis*	☐ Round spots present	☐ Dark red, up to 100% coverage	☐ < 30% attached (stem mostly bare)	☐ > 0.35 mm	☐ Lower glume > 4.6 mm, OR lower glume < 4.6 mm and leaf length < 37 cm



Recommendations for AB

1. Continue early detection and monitoring.
2. Confirm as introduced or native (ID key, genetic).
3. Prevent and eradicate small populations when practical.
4. For unmanageable populations, biocontrol agents may be available as early as spring 2025.
